GUI program in chroot?

Hello everyone, I was just wondering if it is possible to run a graphical program in a chroot? I need to use a program that I can't get working on void linux and I was wondering if I was able to do a chroot into another distro and run that program in there.

Short answer: yes.

I've done it before when my system was musl based but the chroot environment was glibc. Just gotta copy over the xauth "key" from host to chroot environment.

I'll update my comment once I find my notes.

1.) grab key on host:

```
 xauth list
<display name >    <authorization type>  <key>
```

2.) add key on chroot:

```
xauth add  <display name> <authorization type>
```

3.) set display in chroot:

```
export DISPLAY=:0.0
```

For audio, I have not figured it out ...yet.

Edit2: fixed formatting...failed

Edit3: fixed formatting

Edit 4: formating on Reddit app is hell

I do the same thing (musl host with glibc chroot) and my lazy way is run 'xhost +' on the host before chrooting.
I'm using it to run spotify which is both GUI and audio :)

once chrooted: su <my-user-created-in-chroot> -c spotify

If I use 'su - username ...' (i.e. with the dash to get my env) it fails and it doesn't bother me enough to fix (which I assume is what your method does)

Reddit editing does, indeed, stink :)

Need help to install CUDA drivers.

I need to get CUDA drivers running because i use hashcat on my daily work, i tried all the methods i found on reddit, but none of them worked to me, i really don't wanna give up on void :(

solved

Hey!

Today I switched my home server to Void but `ufw` doesn't seem to work... (I got an error after running `sudo ufw enable`). Any ideas on how to fix this?

```
  File "/bin/ufw", line 25, in <module>
    import ufw.frontend
ModuleNotFoundError: No module named 'ufw'
```

Edit: I was able to fix it!

I did `xbps-query ufw` and scrolled all the way down to

gummiboot unified kernel image

Is it possible for Void's gummiboot to detect and boot unified kernel image efi binaries? According to both the arch wiki and systemd-boot manual, systemd-boot is able to detect and boot .efi images located in `esp/EFI/Linux`. However, I am unable to get gummiboot to do this.

Was this functionality added after systemd-boot obsoleted gummiboot or is it available in gummiboot as well?

Gnome Install

Having been impressed with Gnome running on recent versions of Fedora, and reading how solid it performs on Void, I've twice now dabbled trying to install it on top of a fresh install but keep coming a cropper.

Install gdm, dbus, gnome and gnome-apps, consistent with the most recent instructions, but after enabling the services for gdm and dbus and (only) then rebooting, I'm presented with a 'whoops' screen at the point gdm would normally appear on boot.

Is there anything significant that I'm missing as I don't seem to be able to find any definitive or consistent guides on YouTube

Intel microcode updates?

Hi,

When I update void and it downloads something like linux-firmware-intel is the update process flashing new microcode on to the Intel CPU? Or is it just temporarily loading updated microcode into ram?

I have machines that I don't want to receive microcode updates, I know what the situation would be in windows but in

Can't Use River tiling manager with void linux

Hi,

I've currently an issue when i try to use the river tiling manager. I got only a black screen and no input do anything. I'm currently doing my test on a VM (in case it change anything) and i can't figure out what is missing or where i could find some log to help myself.

I'll resume everything i did here (mainly followed the installation guide) :

- Install the base void linux (glibc) with GPT partitioning
- Update the repo with xbps-install -Su

How to prevent DKMS modules being built for kernels I uninstalled?

I just uninstalled a bunch of kernels using this command:

```
sudo xbps-remove linux5.15-5.15.80_1 linux5.15-heade
```

Then I removed the respective kernels from /boot (though keeping the configs, just in case) using:

```
sudo rm /boot/initramfs-5.15.* /boot/vmlinuz-5.15.*
```

But when I tried to install sysdig using: "`sudo xbps-install -S sysdig`" I saw that DKMS modules were being built for the kernels I just uninstalled:

What are template files in the GitHUb?

Good afternoon. I installed Void linux on a virtual machine to try it out and I'm fascinatted with the speed. I also gave some thaught to the comments in my last post about the open source thing and I decided to look into the code of some apps. What are the template files?? I thaught that the apps were hosted on the GitHub but aparently the template files retrieves them from somewhere else????

```
# Template file for 'xfce4-screenshooter'
pkgname=xfce4-screenshooter version=1.10.0
revision=1
build_style=gnu-configure configure_args="--with-loc
makedepends="libxfce4ui-devel xfce4-panel-devel exo-
```

Input device persistent config best practice

What is the best practice for configuring input devices (i.e., trackpad/trackpoint)?

Is it better to edit the Xorg.conf.d files or is it better to script xinput into my xinitrc?

I'm partial to scripting xinput commands as I'd prefer to keep all my configs "together" rather than having them spread out all over the system. However, I'd sacrifice my preference if it's not best practice.

If it matters, I'm not running a seat manager (elogind) so I don't need to worry about global configuration for other users.

How do I fix my fonts being pixelated?

I recently installed base Void version, and I'm having trouble fixing the look of my fonts. They all look pixelated. I believe it is called bitmap or something, but even though there is an article on the official docs, it didn't quite help me fix the issue.

Void Docs: https://docs.voidlinux.org/config/graphical-session/fonts.html

Void bootloader is not seen by mbo

Hi,

I am having problems booting to the fresh Void install. My mbo (MSI MEG ACE Z390) does not see a bootloader even if I have flagged the EFI partition during installation to boot and FAT32 fs.

Running update-grub on my other os do the trick and void is seen by the bootloader by another os (endeavouros).

How do I see package update history?

I'm suddenly having major gaming stability issues today and the only thing I can think that changed from when everything was fine is that I ran updates last night. Is there some way to obtain a list of packages and what versions they were upgraded to and from?
